5. Concluding Remarks

Background Information

Levels of Hartree-Fock Theory

Method	Spinorbital	DoF	Eigenfunction of
Restricted	$\chi_j^\alpha(\vec{r}, \sigma) = \sum_{i=1}^N c_{ij} \phi_i(\vec{r}) \alpha(\sigma)$ $\chi_j^\beta(\vec{r}, \sigma) = \sum_{i=1}^N c_{ij} \phi_i(\vec{r}) \beta(\sigma)$	N/2	\hat{S}^2, \hat{S}_z
Unrestricted	$\chi_j^\alpha(\vec{r}, \sigma) = \sum_{i=1}^N c_{ij}^\alpha \phi_i(\vec{r}) \alpha(\sigma)$ $\chi_j^\beta(\vec{r}, \sigma) = \sum_{i=1}^N c_{ij}^\beta \phi_i(\vec{r}) \beta(\sigma)$	N	\hat{S}_z
General	$\chi_j(\vec{r}, \sigma) = \sum_{i=1}^N [c_{ij}^\alpha \phi_i(\vec{r}) \alpha(\sigma) + c_{ij}^\beta \phi_i(\vec{r}) \beta(\sigma)]$	2N	Neither

Restricted Minimization

- Hartree-Fock SCF guarantees only stationary energy w.r.t. change in orbitals
- The solution may be a maximum, minimum or saddle point

Restricted Minimization

- Hartree-Fock SCF guarantees only stationary energy w.r.t. change in orbitals
- The solution may be a maximum, minimum or saddle point

Within the Constrained Space

Restricted Minimization

- Restricted minima may correspond to minima in another dimension

Restricted Minimization

- Restricted minima may correspond to minima in another dimension
- Restricted minima may correspond to maxima in another dimension

Restricted Minimization

- Restricted minima may correspond to minima in another dimension
- Restricted minima may correspond to maxima in another dimension
- Restricted minima may be nonstationary

Hartree-Fock Stability

Hartree-Fock Stability

- Solving the HF equations guarantees only that the energy is **stationary**. The first order variation is therefore 0.

Hartree-Fock Stability

- Solving the HF equations guarantees only that the energy is **stationary**. The first order variation is therefore 0.
- We need to know if this is indeed a minimum.

Hartree-Fock Stability

- Solving the HF equations guarantees only that the energy is **stationary**. The first order variation is therefore 0.
- We need to know if this is indeed a minimum.
- We can determine this if we inspect the **second order variation** in the energy.

Hartree-Fock Stability

- Solving the HF equations guarantees only that the energy is **stationary**. The first order variation is therefore 0.
- We need to know if this is indeed a minimum.
- We can determine this if we inspect the **second order variation** in the energy.
- Thouless¹ showed a physically motivated derivation using Time-Dependent Hartree-Fock theory (TDHF).

Hartree-Fock Stability Conditions

- The RPA frequencies represent electronic oscillations about the ground state

Hartree-Fock Stability Conditions

- The RPA frequencies represent electronic oscillations about the ground state
- Real frequencies are stable, imaginary frequencies are unstable

Hartree-Fock Stability Conditions

- The RPA frequencies represent electronic oscillations about the ground state
- Real frequencies are stable, imaginary frequencies are unstable
- The RPA frequencies are imaginary when the **Orbital Hessian** (aka stability matrix, electronic Hessian) eigenvalues are **negative**

$$\begin{bmatrix} \mathbf{A} & \mathbf{B} \\ \mathbf{B}^* & \mathbf{A}^* \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{Y} \end{bmatrix} = \omega \begin{bmatrix} \mathbf{X} \\ \mathbf{Y} \end{bmatrix} \quad (1)$$

Hartree-Fock Stability Conditions

- The RPA frequencies represent electronic oscillations about the ground state
- Real frequencies are stable, imaginary frequencies are unstable
- The RPA frequencies are imaginary when the **Orbital Hessian** (aka stability matrix, electronic Hessian) eigenvalues are **negative**

$$\begin{bmatrix} \mathbf{A} & \mathbf{B} \\ \mathbf{B}^* & \mathbf{A}^* \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{Y} \end{bmatrix} = \omega \begin{bmatrix} \mathbf{X} \\ \mathbf{Y} \end{bmatrix} \quad (1)$$

- Where

$$\begin{aligned} A_{ia,jb} &= \langle i^a | H - E_0 | j^b \rangle = (\epsilon_a - \epsilon_i) \delta_{ij} \delta_{ab} + \langle aj || ib \rangle \\ B_{ia,jb} &= \langle ij^a | H - E_0 | 0 \rangle = \langle ab || ij \rangle. \end{aligned} \quad (2)$$

Hartree-Fock Stability Conditions

The Matrix Equation Factorizes

Solution Type	Space Type					
	Real RHF	Complex RHF	Real UHF	Complex UHF	Real GHF	Complex GHF
Real RHF	${}^1\mathbf{A}' + {}^1\mathbf{B}'$	${}^1\mathbf{A}' - {}^1\mathbf{B}'$	${}^3\mathbf{A}' + {}^3\mathbf{B}'$	${}^3\mathbf{A}' - {}^3\mathbf{B}'$	${}^3\mathbf{A}' + {}^3\mathbf{B}'$	${}^3\mathbf{A}' - {}^3\mathbf{B}'$
Complex RHF	-	${}^1\mathbf{H}'$	-	${}^3\mathbf{H}'$	-	${}^3\mathbf{H}'$
Real UHF	-	-	$\mathbf{A}' + \mathbf{B}'$	$\mathbf{A}' - \mathbf{B}'$	$\mathbf{A}'' + \mathbf{B}''$	$\mathbf{A}'' - \mathbf{B}''$
Complex UHF	-	-	-	\mathbf{H}'	-	\mathbf{H}'
Real GHF	-	-	-	-	$\mathbf{A} - \mathbf{B}$	$\mathbf{A} - \mathbf{B}$
Complex GHF	-	-	-	-	-	\mathbf{H}

Table reproduced from Seeger & Pople¹

Homogeneous Electron Gas

Brief Overview

- Homogeneous Electron Gas (HEG) model, also known as Uniform Electron Gas or Jellium Model.
- Electrons in a box with "smeared" nuclei \rightarrow uniform positive background charge
- The total charge is constrained to be neutral,

$$V_{bg}(\mathbf{r}) = \sum_i \frac{-Ze^2}{|\mathbf{r} - \mathbf{R}_i|} \rightarrow -e^2 \int \frac{d\mathbf{r}'}{|\mathbf{r} - \mathbf{r}'|}, \quad (3)$$

- and the background and coulomb terms cancel exactly,

$$V_{ee} = e^2 \int \frac{d\mathbf{r}'}{|\mathbf{r} - \mathbf{r}'|}. \quad (4)$$

Brief Overview

- The discretized solutions are given by,

$$\epsilon_{\vec{k}} = \frac{\hbar^2 k^2}{2m} - \sum_{\vec{k}'}^{|\vec{k}'| < k_f} \langle \vec{k}, \vec{k}' | \vec{k}', \vec{k} \rangle \quad (5)$$

- Where the two electron integral is given by

$$\langle \vec{k}, \vec{k}' | \vec{k}'', \vec{k}''' \rangle \stackrel{2D, 3D}{=} \begin{cases} \frac{\pi}{V} \frac{2^{D-1}}{|\vec{k} - \vec{k}''|^{D-1}} & \vec{k}''' = \vec{k} + \vec{k}' - \vec{k}'' \\ 0 & \text{else} \end{cases}$$
$$\langle k, k' | k'', k''' \rangle \stackrel{1D}{=} \begin{cases} \frac{\pi}{V} e^{|k-k''|^2 a^2} \text{Ei}(-|k-k''|^2 a^2) ; & k''' = k + k' - k'' \\ 0 ; & \text{else} \end{cases} \quad (6)$$

Exact Results

QMC Energies for various phases

Project Goal

- Can we use the HF-Stability analysis to determine where the HEG is unstable?

Project Goal

- Can we use the HF-Stability analysis to determine where the HEG is unstable?
- Will this predict the known tendency of crystallization at low density?

Project Goal

- Can we use the HF-Stability analysis to determine where the HEG is unstable?
- Will this predict the known tendency of crystallization at low density?
- It is known that the GHF solution persists at all densities for the HEG¹.

Project Goal

- Can we use the HF-Stability analysis to determine where the HEG is unstable?
- Will this predict the known tendency of crystallization at low density?
- It is known that the GHF solution persists at all densities for the HEG¹.
- Can we show this numerically?

Project Goal

- Can we use the HF-Stability analysis to determine where the HEG is unstable?
- Will this predict the known tendency of crystallization at low density?
- It is known that the GHF solution persists at all densities for the HEG¹.
- Can we show this numerically?
- (Future) Can we combine this with to improve the efficacy of correlation theories (CC, MBPT)?

Results

First Brillouin Zone

- Excite Only in one direction
- Consider only First BZ due to $\vec{k}' = \vec{k} + \vec{G}$

Orbital Energies

- 57 grid points per dimension reproduces the orbital energies reasonably well
- Worst towards Γ , better for higher $|\vec{k}|$

Convergence of Stability Curves

Predicted Singlet Instability Onset

Predicted Triplet Instability Onset

Dependence on r_s

Previously reported transition in 2d: $r_s \approx 0.8$

Final Stability Curves

Concluding Remarks

- Numerical studies likely support Overhauser's theorem in 1D
- Stability corresponds with direct phase calculations in 2D
- In 3D, predicts transition at higher density than is currently known via other methods.

Next Steps

- Directly calculate more exotic spin phases of HEG within HF theory
- Use those as starting points for CC, MBPT theories
- Apply a similar approach to finite molecular systems

Questions?

Iterative Subspace Eigenvalue Methods

Davidson's Algorithm

$\mathbf{Ax} = \lambda \mathbf{x}$	Eigenvalue Problem
$\mathbf{V} = [\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_M]$	Guess vectors
$\tilde{\mathbf{A}} = \mathbf{V}^\dagger \mathbf{A} \mathbf{V}$	Transform into subspace
$\tilde{\mathbf{A}} \tilde{\mathbf{x}} = \tilde{\lambda} \tilde{\mathbf{x}}$	Solve the subspace problem
$\mathbf{x}_i \approx \mathbf{x}_i^R = \mathbf{V} \tilde{\mathbf{x}}_i$	Approximate eigenvectors
$\lambda_i \approx \lambda_i^R = \tilde{\lambda}_i$	Approximate eigenvalues
$\mathbf{r}_i = (\mathbf{A} - \lambda_i \mathbf{I}) \mathbf{x}_i^R$	Calculate the residue
$\delta_i = c_i \mathbf{r}_i$	Correction vectors
$c_i = \frac{1}{\lambda_i \mathbf{I} - \mathbf{D}}$	Diagonal Precondition
$\mathbf{V} = [\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_M, \delta_1, \delta_2, \dots, \delta_I]$	Append to guess and restart
$\mathbf{V} = \textit{orthonormalized}(\mathbf{V})$	Ensure orthonormal projection

Convergence Properties

- The convergence of these subspace algorithms depends on:

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors
 - The preconditioner (Davidson only)

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors
 - The preconditioner (Davidson only)
- They can have convergence issues if:

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors
 - The preconditioner (Davidson only)
- They can have convergence issues if:
 - The block size is too small compared to degeneracy

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors
 - The preconditioner (Davidson only)
- They can have convergence issues if:
 - The block size is too small compared to degeneracy
 - The approximate eigenvectors become non-orthogonal

Convergence Properties

- The convergence of these subspace algorithms depends on:
 - Number of eigenvalues requested
 - The block size of the algorithm
 - The density of the eigenvalue spectrum
 - The initial guess eigenvectors
 - The preconditioner (Davidson only)
- They can have convergence issues if:
 - The block size is too small compared to degeneracy
 - The approximate eigenvectors become non-orthogonal
- My recommendation for guess eigenvectors is

$$v_j^{(i)} = \textit{normalize} \left(\frac{1}{|A_{ii} - A_{jj}| + 1} \right). \quad (7)$$

1. Saad, Y. Numerical Methods for Large Eigenvalue Problems; SIAM, 2011.
2. Li, R.-C.; Zhang, L.-H. Convergence of Block Lanczos Method for Eigenvalue Clusters; 2013.

Davidson Scaling

- Davidson is Asymptotically quadratic.
- Full diagonalization is almost cubic.
- Matrix multiplication is order¹ $\log_2(7) \approx 2.807$

1) <http://mathworld.wolfram.com/StrassenFormulas.html>

Efficacy of Davidson's Algorithm

- Reproduces Exact result to machine precision in all test cases.
- Odd spikes are due to approximating circle by squares

Orthogonalization

- The condition number, κ , is bound from below by

$$\kappa \geq \frac{\text{Max}(A_{ii})}{\text{Min}(A_{jj})} \quad (8)$$

- The Gram-Schmidt procedure has numerical issues,

$$\|\mathbf{I} - \mathbf{Q}^T \mathbf{Q}\| \leq \frac{\alpha \kappa^2}{1 - \beta \kappa^2}. \quad (9)$$

- Modified Gram-Schmidt is better, but not perfect,

$$\|\mathbf{I} - \mathbf{Q}^T \mathbf{Q}\| \leq \frac{\gamma \kappa}{1 - \eta \kappa} \quad (10)$$

- May need multiple orthogonalization steps
